Add Dense Layers:

This step is to add a dense layer (output layer) where you will be specifying the number of classes your dependent variable has, activation function, and weight initializer as the arguments. We use the add () method to add dense layers. the output dimensions here is 6.

```
model.add(Dense(40,  
'relu'))  
model.add(Dense(20,  
'relu'))  
model.add(Dense(6,  
'softmax', ))
```
